INTRODUCTION

This paper craft flower is a simple way to jazz up any fancy occasion.

You'll need an LED, a CR2032 battery, a binder clip, and some Maker Tape.

Choose from a full-color version or a black & white version that makes a great coloring activity. You can also make it using colorful construction paper.

You can make this project (and many more!) with our **Paper Circuits Kit**.

TOOLS:

- Scissors (1)
- Clear Tape (1)
- Glue (1)
- Markers, Crayons, or Colored Pencils (1)

PARTS:

- Paper Circuits Kit (1)

Step 1 — LED Paper Craft Flowers

- **Gather the materials listed.**

- **Cut** out the petals, stem and leaves.

- **Color if you wish OR use one of the already colored printable versions** included in the PDF at the bottom of this guide.
Step 2

- **Line your petals up how you want them to be arranged in relation to one another.**

- **Use a push pin or paperclip point to punch two small holes next to one another** in the center all the way through the petals.

- **Thread the LED legs through the holes of all petals.**

Step 3

- **Measure and cut** one Maker Tape segment that is roughly the length of the stem.

- **Peel and stick that tape segment** where shown in the second photo.
Step 4

- **Measure and cut another Maker Tape segment** roughly the length of the stem.

- **Flip your project over. Peel and stick** that new tape segment where shown in the second photo.

Step 5

- **Measure and cut a new Maker Tape segment** roughly 2x the length of the tab (a little extra is fine).

- **Peel and stick that new tape segment into place** contacting the lower end of the last tape segment you placed, along the length of the tab, and around to the front of the tab.

- **Be sure to stop this path on the dotted line on the stem template.** This should create a small gap between it and the long tape path running along the stem.

Step 6

- **Measure and cut two Maker Tape segments that are 1-2" long.** These will be used to connect each of the LED legs to the paths on either side of the stem.

- **Peel one of your new tape segments and stick it on the corner of your work table.** You'll have to briefly hold the flower in position with one hand in a moment and having the tape already peeled and ready to go will make the step after easier.

- **Lower the petal cluster over the top of the stem** so the shorter LED leg is on the "tape gap" side of the stem and the longer LED is on the opposite side.

Step 7

- **Using your free hand, stick that already peeled Maker Tape segment over the top of the short leg** so that it is sandwiched between Maker Tape and held in place.

- **Use the remaining piece of Maker Tape** to do the same to the longer LED atop the stem path on the opposite side.
Step 8

- **Cut two new, small pieces of Maker Tape.**

- **Use one of these pieces to create a tape loop.**

- **Stick this tape loop where shown in photo 3.**

Page 7 of 9

Step 9

- **Stick battery atop this tape loop** so that the positive (+) side is facing UP.

- Use the remaining piece of Maker Tape to **make another tape loop and place IT where shown in photo 3**.
Step 10

- **Fold tab over to stick that newest tape loop to the top of the battery.** This should turn your circuit on. **If it doesn't turn on**, it's likely that you have the LED legs flipped. Rather than redoing those connections, you CAN just flip the battery around and it should work.

- **Use your binder clip to clip around the entire battery portion of your project** .This will hold the connection firmly in place.

Step 11

- **Glue leaves together into a cluster.**

- **Glue cluster atop stem to finish.**

Step 12

- **You're done...Congrats!** Now, go give it to a friend who needs some cheering up!
